* Prefs Intro

The *3Delight Preferences* dialog offers options for a user to configure based on how he or she likes to use *3Delight* per his or her personal preference. As such, these settings:

- are independent of the scenes and projects the user is working on;
- have no effect on the resulting image from the rendering process (therefore, they do not affect the project a user is working on).

All the preferences listed here are ignored during batch rendering.
