

Color Correction

The Color Correction utility node

This utility node allows color correction operations on an input color. Gamma correction, hue shift, saturation modification and contrasting are supported.

Gamma

Apply a gamma correction to the input color, if Gamma different that 1.

Result = $\text{pow}(\text{Input}, 1/\text{Gamma})$

0.5

1.0

2.0

Hue Shift

Rotate the hue by the given amount. Default is 0.

$$\text{Result Hue} = \text{Input Hue} + \text{Hue Shift}$$

Note that a value of 1 means full rotation and gives the same result as 0 (in other words, 1 is a 360 degrees rotation).

0.0

0.33

0.66

Saturation

Multiplies colour's saturation by the given value. Default is 1.

$$\text{Result Saturation} = \text{Input Saturation} * \text{Saturation}$$

0.2

1.0

1.4

Vibrance

Vibrance performs a more pleasant modification of color's saturation. Leaving already saturated areas unchanged and having effect on unsaturated colors. Default is 1.

0.0

1.0

2.0

Contrast

Perform a contrasting operation on the color. The value is scaled around the provided pivot.

$Result = (Corrected - \text{Contrast Pivot}) * \text{Contrast} + \text{Contrast Pivot}$

0.5

1.0

1.5

Contrast Pivot

0.18

0.5

0.7

Exposure

Multiplies the corrected color by 2^{Exposure} . Default is 0.

-2.0

0.0

2.0

Offset

Adds this color to the corrected color. Default is 0.

$Result = Corrected + Offset$

Invert

Invert the output color. Default is OFF.

$Result = 1 - clamp(Corrected, 0, 1)$

On

Off
